

Personal Learning in the Age of AI

Stephen Downes

OTESA 2026

June 9, 2026

Every technology we use represents a choice

- Who makes that choice?
- Could there ever be an opt-out?
- Considering the harms...
 - Data security
 - Privacy and surveillance
 - Stress of change
 - Accessibility

- Brenna Clarke Gray
- https://drive.google.com/drive/folders/1y5oXw-3RcoHYf_R0dHqQrHRg1Ow5FghN

The logic of education is one which values knowledge as a public good, a commons, and a shared human inheritance - Bonnie Stewart - Beyond BigAI: Agency as Educational Practice

The problem with platforms

In the LMS era, the platform organized the learning experience.

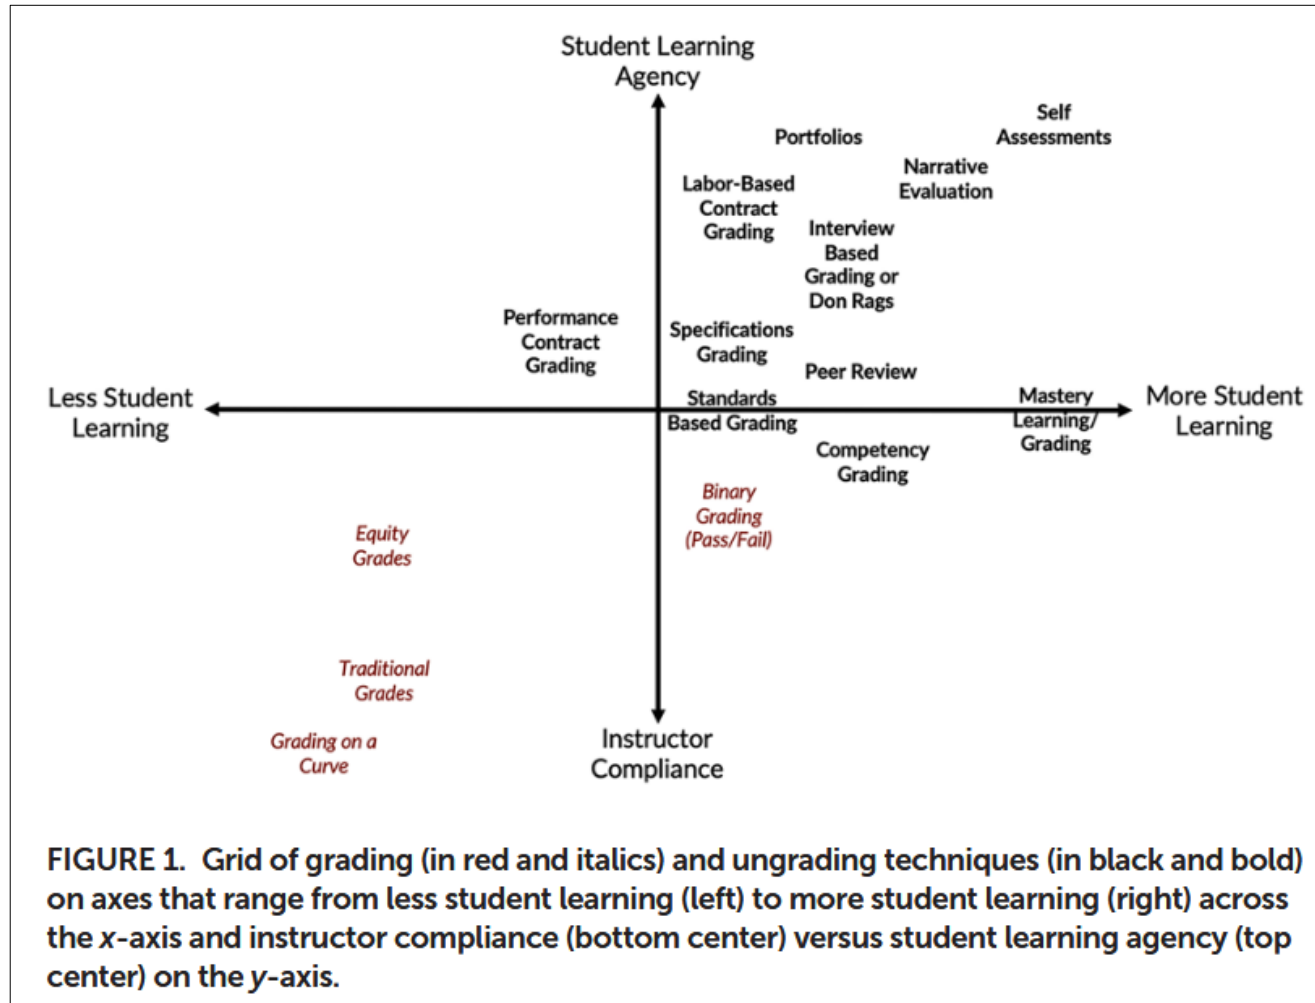

Today, we're just adding AI to the platform.

Learners do not define their own learning environment. It is defined for them by institutions, vendors, recommender systems, or AI defaults.

Image: LMSpedia <https://lmspedia.org/lms-components-explained-core-features-architecture/>

We have often make the wrong choices in education

The point of learning in an asset frame is not to fill a hole in the student or assume that they have the wrong knowledge upon entry to higher education classrooms, but to enable students to share their knowledge openly and to build on that knowledge in ways that benefit the learning of student and the learning of the class

Clarissa Sorensen-Unruh

Digital Platform Charter of Rights

A declaration of fundamental rights and principles for ethical digital platforms, ensuring privacy, dignity, and fairness in online spaces.

<https://respectfulplatforms.org/>

- Right to privacy
- Freedom from surveillance
- Safeguards against hate speech
- Strong protections for vulnerable communities
- Data portability and user agency
- Transparency and accountability
- Safety and well-being
- Transparent cybersecurity posture
- Fairness in algorithmic systems
- Inclusive community and governance
- Continuous improvement and evolution

Here's what I want to say

A personal learning environment in the age of AI should be an architecture of agency.

It should be a learner-defined environment in which people choose and connect their sources, tools, identities, storage, publishing destinations, collaborators.

The role of AI is to help individuals and institutions overcome the barriers to personal learning that have led to disappointing technology choices in the past.

Personal Learning

Personalization

The system adapts to the learner

Vendor-defined pathways

Platform owns and controls the data

AI recommends

Optimization

Personal Learning

The learner shapes the system

Learner-defined architecture

Learner owns and controls the data

AI is directed

Agency

How to Help Students Succeed by Taking Ownership of Their Learning Online Through Personal Learning
<https://www.downes.ca/presentation/524>

Image: Nexus <https://nexus-education.com/blog-posts/developing-your-personal-learning-network-pln/#>

An architecture of agency

Personal learning means the learner has meaningful control over:

- Identity - Who am I across systems?
- Sources - What do I read, watch, follow, or subscribe to?
- Annotation - How do I respond while reading?
- Memory / storage - Where are my notes, credentials, drafts, and records?
- Composition - How do I synthesize, reflect, argue, and create?
- AI services - Which models or agents do I use, and for what?
- Publishing - Where does my work go?
- Social feedback - Who can reply, annotate, remix, or build on it?
- Governance - Who sets the rules, permissions, and defaults?

An architecture of agency doesn't just define mechanisms of choice for each of these, it provides viable *access* to them through common interfaces

An architecture of agency

An architecture of agency defines the interfaces between the elements of a learning environment so people can select, replace, combine, or reject components.

It should allow different learners to build different environments based on their own needs, values, culture and commitments.

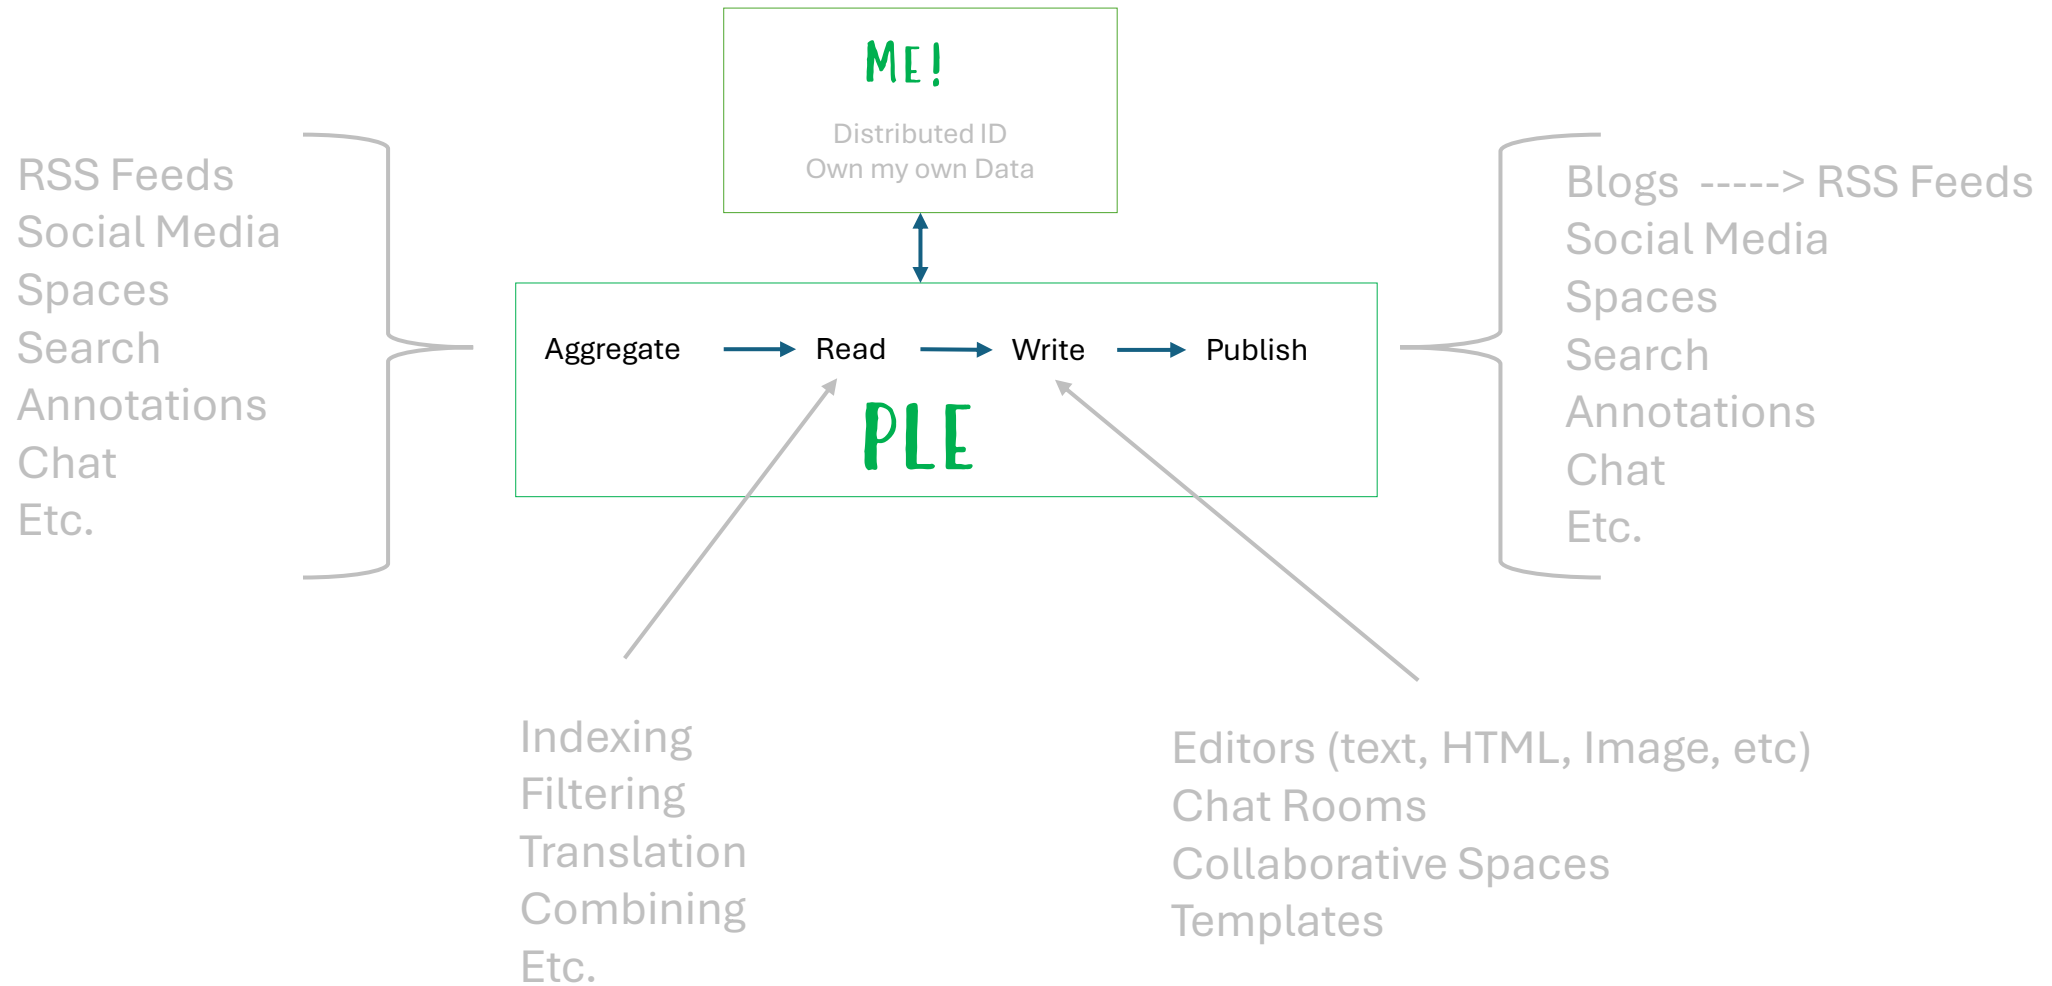

There's a parallel with the open web here:

- Open protocols
- Interoperability
- Permissionless innovation
- User agency and portability
- Decentralization

Center for Democracy and Technology
<https://cdt.org/insights/preserving-the-open-internet-through-interoperability/>

Michael Nolan
<https://spectrum.ieee.org/doctorow-interoperability>

No single platform, distributed architecture, open Source, personal data ownership

Clist: Building interfaces between these elements

The screenshot displays the Clist web application interface, which is designed to bridge different social media and content management systems. The interface is divided into several main sections:

- Top Navigation:** Features buttons for 'Logout', 'Accounts', 'Me', 'Read', 'Find', and 'Chat'.
- Left Sidebar:** Contains user identity information ('Identity: downes') and a list of accounts to read, including Annotations, Downes, OLDaily, Cosocial, OpedEd, Cogdog, Bluesky, Andy, and Small RSS.
- Home Feed:** The central area showing a 'Home Feed' with posts. The first post is from 'The Calyx Institute' (@calyxinstitute) regarding U.S. House lawmakers demanding representatives from Instructure. The second post is a reblog by 'Eugen Rochko' (@Gargron) about a cat named Soot.
- Post Editor:** On the right, there is a text input field containing 'w4mqui', a rich text editor with options for 'Share', 'Annotate', 'B', 'I', 'H1', 'H2', 'H3', '1.', and '•', and a 'Publish' button.
- Right Sidebar:** Shows 'editor: Collab' and a list of accounts to publish to, including Downes, OLDaily, Cosocial, Half an Hour, Bluesky, Leftish, Annotations, and Hypothesis.

The core design principles

Browser-based, not platform-based

- no server-side logic, no backend to install
- each user runs their own instance; no central platform, no shared data store
- accounts, credentials, feed collections, and annotations all belong to the user - stored encrypted, private by default
- can be deployed anywhere: a personal server, a CDN, or localhost

Radical decentralization

- no mandatory central server - the app itself is a static bundle of HTML/CSS/JS
- supporting services (credential storage, feed proxy, collaborative editing, peer discovery, annotations) are each independently deployable
- users configure which instance of each service they use, or run their own
- API calls to services are made directly from the browser; CList is never in the middle

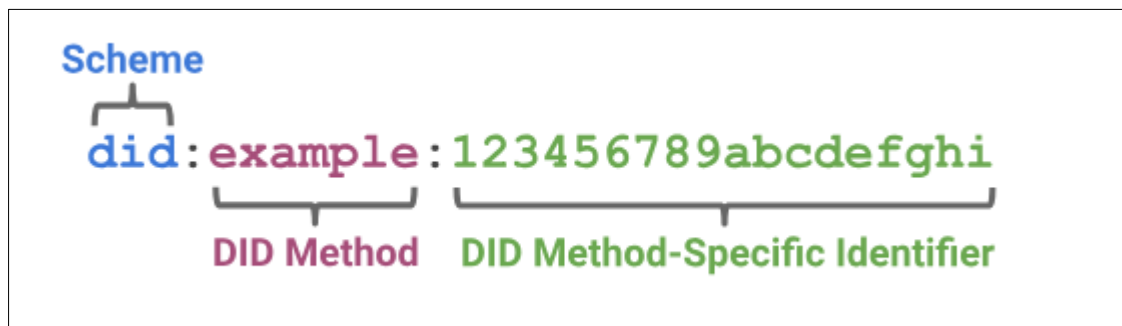

Decentralized identity

Credential store

- all service credentials (tokens, passwords, API keys) are stored in a remote kvstore that holds only AES-GCM ciphertext
- it never sees plaintext credentials - not even its own

DID

“In contrast to typical, federated identifiers, DIDs have been designed so that they may be decoupled from centralized registries, identity providers, and certificate authorities.”

Accounts and credentials

Account schemas

- Different forms of authentication are supported (key, OAuth, more...)
- Every service that needs credentials registers a schema: field definitions, permissions, form behavior
- Service actions are defined using a set of handlers (one handler for each interface area - feed functions, status actions, publish...)

Identity: downes Cosocial

Pick an account type to add

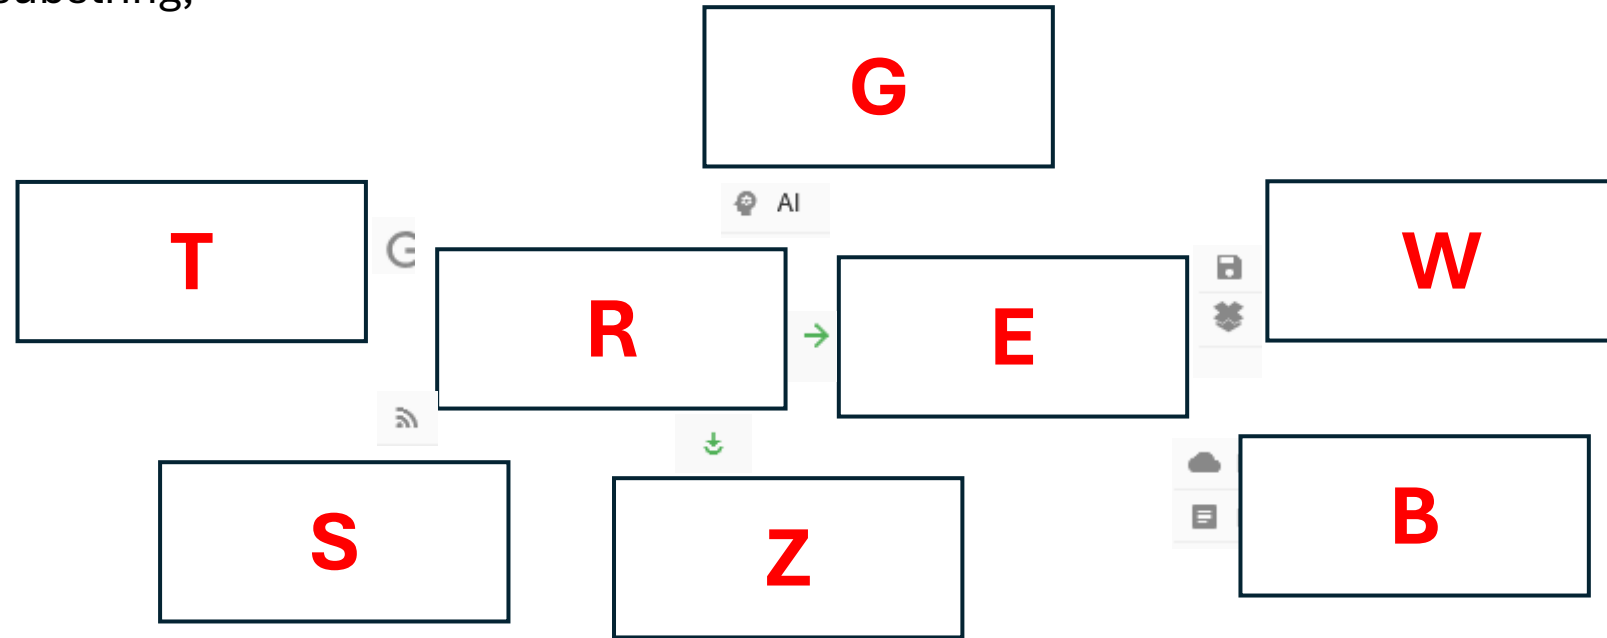

- Mastodon
- Bluesky
- WordPress
- OPML
- RSS
- Blogger
- Etherpad
- Collab
- AI
- Proxyp
- Annotate
- Hypothesis
- JSONBin
- Gist
- 0x0
- CListBin
- Dropbox

Authentication: <https://www.okta.com/identity-101/authentication-protocols/>
OAuth 2.0 <https://oauth.net/2/>

Account types

Permissions flags (substring, composable):

- **r** read
- **w** write
- **e** editor
- **t** translate
- **g** AI
- **z** summarize
- **s** RSS relay
- **b** bin/publish

This is probably an incomplete list. Account types are defined by their interfaces and handlers. No specific services are required (not even identity services). Any service that can provide the interface can be a part of Clist.

Readers

Feed definitions

Read

Feed Sources

Find

The screenshot shows a Mastodon reader interface. At the top, there's a navigation bar with buttons for Post, Following, Notifications, Bookmarks, Lists, Local, Hashtag, and User. Below this is a 'Home Feed' section. A post from Tel Amiel is visible, with a link to a UNESCO Chair in Open Education. Below the post are icons for Reply, Boost, Like, Bookmark, Expand, Collect, and Chat. On the left, there's a sidebar with 'Identity: downes' and a list of accounts to read, including Downes, OLDaily, Cosocial, OpedEd, Cogdog, Bluesky, Andy, and Small RSS. At the bottom, there's a search bar and a list of search services: Google, DuckDuckGo, and OASIS OERs. Annotations with arrows point to various elements: 'Feed Sources' points to the account list; 'Status Actions' points to the interaction icons; 'CList Actions' points to a green arrow icon; and 'Send to editor' points to the 'Send to editor' text.

Save as collection

editor: Collab

Select accounts to publish to

- Downes
- OLDaily
- Cosocial
- Half an Hour
- Bluesky
- Leftish
- Annotations
- Hypothesis

Publish

Interaction and Collaboration

Following

- in CList, people follow other people by DID
- Who you follow is your private information

Chat

- Peer-to-peer chat, no central chat server
- Invite to chat, creates opportunities to follow

Annotations

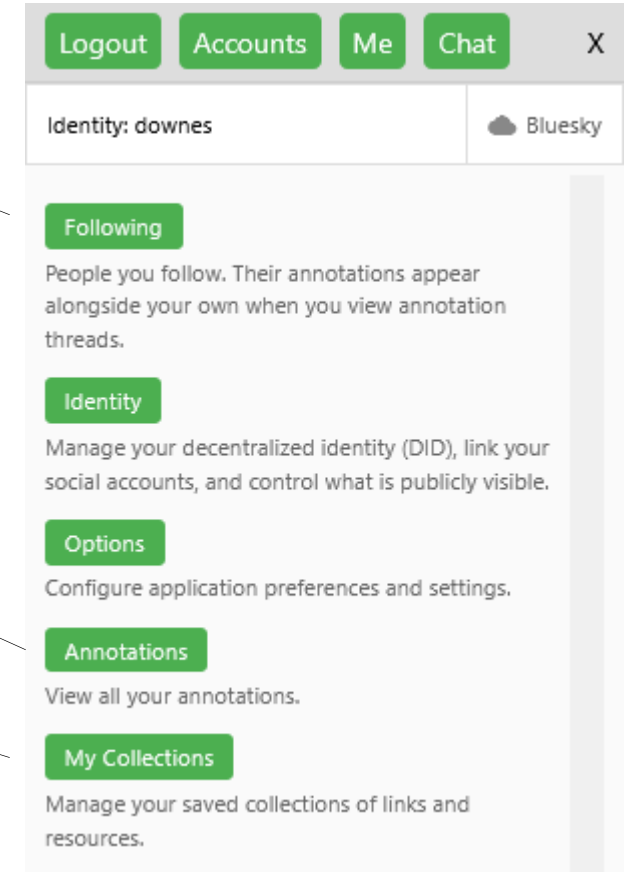

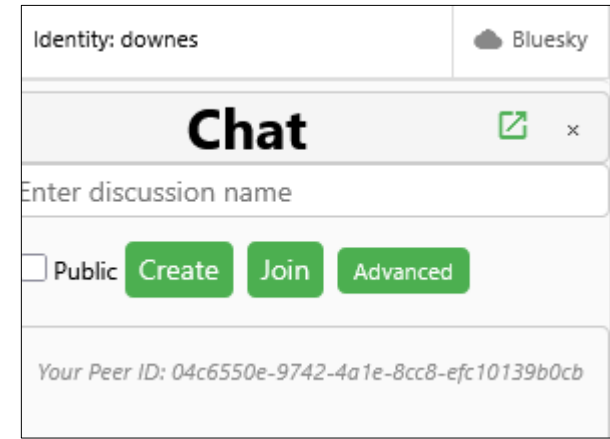

- Attached to any type of content
- No central annotations server
- Viewed by followers

Collections

- Are a document type
- Can be published as RSS, OPML, JSON
- Can be shared and merged

Collaborative Editing

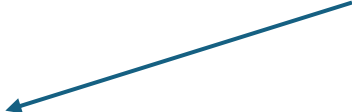

- Is an editor type
- Invite in from chat or via URL

Taking privacy seriously

- CList does not aggregate or transmit user activity between services - API calls go directly from browser to platform
- What is private: passwords/API keys (never leave the browser in plaintext), reading history, cross-service correlations, social graph (encrypted in kvstore)
- What is not private: annotation batch checks reveal reading activity to the annotation server; RSS polling reveals IP and timing to feed hosts; social platform API calls are visible to those platforms
- Follow graph is private to the follower - by design, CList never publishes "who follows you" because that would require centralizing follower data
- Annotation visibility: public or private; no followers tier (would require server-side social graph queries, violating decentralization)

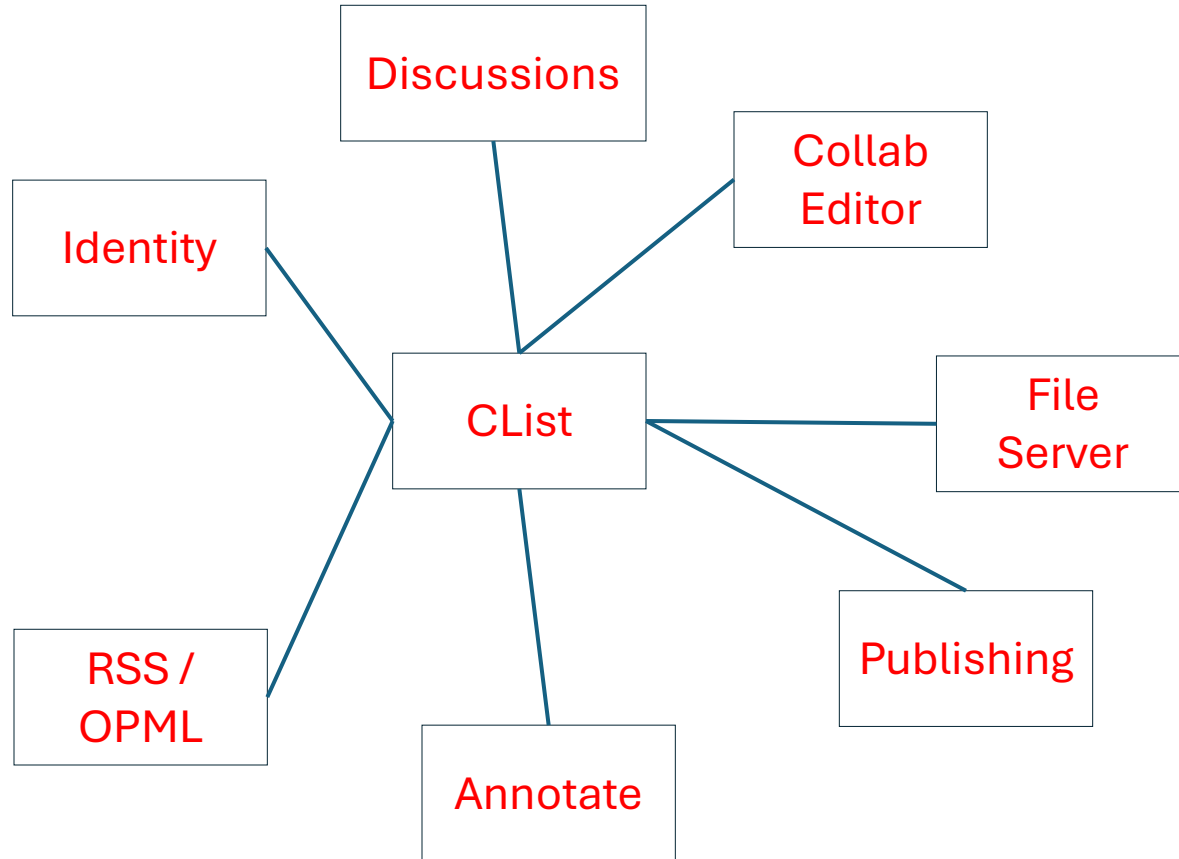

But you can host your own

Can't be commodified or used for advertising

Key services

Key services

- kvstore (credentials)
- localRSS (RSS aggregator)
- opml2json (feed parsing)
- annotations (annotations)
- collab (Hocuspocus collab editor)
- pastebin - plain file server
- discussions (P2P discovery)
- proxyp (cross-domain proxy)
- care (publishing on IPFS)

- Clist browser extension (annotate & collect)
- WordPress extension (add DID to RSS feed)

Deployment

- Static files served by Caddy — no server-side processing
- Supporting services run in Docker containers on the same VPS, each on the web network, reverse-proxied by Caddy
- CORS handled entirely in Caddy (not in Flask), to avoid OPTIONS header injection failures with flask-cors
- Desktop launcher: PKCE OAuth flow bridged via `callback.html?local_port=PORT` to handle HTTP-only localhost
